

Technology Induction in bee migration unit in association with NCCD

NBB facilitated through National Centre for Cold Chain Development (NCCD), technology induction in a bee migratory reefer vehicle in Patiala for the benefit of Beekeepers. Migration of bee colonies from place to place is an integral part of beekeeping activities and often resorted to by the beekeepers as per availability of fresh pastures of bee friendly flora. While pollination of crops is an inherent benefit accruing to the farmers, migration of bee colonies also enables larger production of honey and other hive products. Technology induction in a bee migratory reefer vehicle is expected to help reduce mortality of bees during long spells of migration from the elements of nature, especially in summer.
